# CS306: Announcements

- ◆ HW2 did not come – too much in view of next week's midterm exam
- ◆ Road ahead
  - ◆ ~~no lecture on October 13 (next week, classes will run on Monday schedule)~~
  - ◆ regular lecture on October 20
  - ◆ midterm exam on October 27
    - ◆ online exam, quiz format
    - ◆ accommodations to be provided as needed
    - ◆ covers all materials discussed so far: lectures 1-7, labs 1-7, HW1
    - ◆ Lab 7 will offer a general revision on most important topics
    - ◆ exact list of topics to be provided tomorrow

**7.1 Public-key encryption  
& digital signatures**

Add WeChat powcoder

# Recall: Principles of modern cryptography

(A) security definitions, (B) precise assumptions, (C) formal proofs

For **symmetric-key** message encryption/authentication

- ◆ adversary
  - ◆ types of attacks
- ◆ trusted set-up
  - ◆ secret key is distributed securely
  - ◆ secret key remains secret
- ◆ trust basis
  - ◆ underlying primitives are secure
  - ◆ PRG, PRF, hashing, ...
    - ◆ e.g., block ciphers, AES, SHA-2, etc.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# On “secret key is distributed securely”

Alice & Bob (or 2 individuals) must **securely obtain** a **shared secret key**

- ◆ “securely obtain”
  - ◆ need of a secure channel
- ◆ “shared secret key”
  - ◆ too many keys

**strong assumption** to accept

Assignment Project Exam Help

<https://powcoder.com>

**challenging problem** to manage

Add WeChat powcoder

**Public-key cryptography to the rescue...**

# On “secret key is distributed securely”

Alice & Bob (or 2 individuals) must **securely obtain** a **shared secret key**

- ◆ “securely obtain”
  - ◆ requires secure channel for key distribution (chicken & egg situation)
  - ◆ seems impossible for two parties having no prior trust relationship
  - ◆ not easily justifiable to hold a priori
- ◆ “shared secret key”
  - ◆ requires too many keys, namely  $O(n^2)$  keys for  $n$  parties to communicate
  - ◆ imposes too much risk to protect all such secret keys
  - ◆ entails additional complexities in dynamic settings (e.g., user revocation)

(A) **strong assumption** to accept

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

(B) **challenging problem** to manage

# Alternative approaches?

Need to securely distribute, protect & manage many **session-based** secret keys

- ◆ (A) for secure distribution, just “make another assumption...”
  - ◆ employ “**designated**” secure channels
    - ◆ physically protected channel (e.g., meet in a “sound-proof” room)
  - ◆ employ “**trusted**” party
    - ◆ entities authorized to distribute keys (e.g., key distribution centers (KDCs))
- ◆ (B) for secure management, just “live with it!”

**Public-key cryptography to the rescue...**

# Public-key (or asymmetric) cryptography

disclaimer on names  
private = secret

Goal: devise a cryptosystem where key setup is “more” manageable

Main idea: **user-specific** keys (that come in pairs)

- ◆ user  $U$  generates two keys ( $U_{pk}, U_{sk}$ )
  - ◆  $U_{pk}$  is **public** – it can safely be known by everyone (even by the adversary)
  - ◆  $U_{sk}$  is **private** – it must remain secret (even from other users)

Usage

- ◆ employ **public** key  $U_{pk}$  for certain “**public**” tasks (performed by **other users**)
- ◆ employ **private** key  $U_{sk}$  for certain “**sensitive**” tasks (performed by **user  $U$** )

Assumption

- ◆ **public-key infrastructure (PKI)**: public keys become **securely** available to users

# From symmetric to asymmetric encryption

## secret-key encryption

- ◆ main limitation

- ◆ **session-specific** keys

## public-key encryption

- ◆ main flexibility

- ◆ **user-specific** keys

<https://powcoder.com>

Add WeChat [powcoder](https://powcoder.com)

**"sensitive" task**

- ◆ messages encrypted by receiver's PK can (only) be decrypted by receiver's SK

# From symmetric to asymmetric message authentication

secret-key message authentication (or MAC)

- ◆ main limitation

- ◆ **session-specific** keys

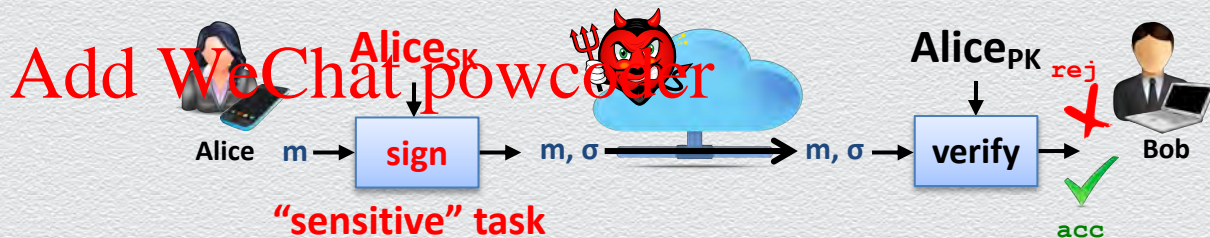

public-key message authentication

(or **digital signatures**)

- ◆ main flexibility

- ◆ **user-specific** keys

- ◆ (only) messages signed by sender's SK can be verified by sender's PK

# Thus: Principles of modern cryptography

(A) security definitions, (B) precise assumptions, (C) formal proofs

For **asymmetric-key** message encryption/authentication

- ◆ adversary
  - ◆ types of attacks
- ◆ trusted set-up
  - ◆ PKI is needed
  - ◆ secret keys remain secret
- ◆ trust basis
  - ◆ underlying primitives are secure
  - ◆ typically, **algebraic** computationally-hard problems
    - ◆ e.g., **discrete log**, **factoring**, etc.

Assignment Project Exam Help

Add WeChat powcoder

# General comparison

## Symmetric crypto

- ◆ key management
  - ◆ less scalable & riskier
- ◆ assumptions
  - ◆ secret & authentic communication
  - ◆ secure storage
- ◆ primitives
  - ◆ generic assumptions
  - ◆ more efficiently in practice

## Asymmetric crypto

- ◆ key management
  - ◆ more scalable & simpler
- ◆ assumptions
  - ◆ authenticity (PKI)
  - ◆ secure storage
- ◆ primitives
  - ◆ math assumptions
  - ◆ less efficiently in practice (2-3 o.o.m.)

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Public-key infrastructure (PKI)

A mechanism for securely managing, in a dynamic multi-user setting, user-specific public-key pairs (to be used by some public-key cryptosystem)

- ◆ **dynamic, multi-user**
  - ◆ the system is open to anyone; users can join & leave
- ◆ **user-specific public-key pairs**
  - ◆ each user  $U$  in the system is assigned a unique key pair  $(U_{pk}, U_{sk})$
- ◆ **secure management** (e.g., authenticated public keys)
  - ◆ public keys are authenticated: current  $U_{pk}$  of user  $U$  is publicly known to everyone

Very challenging to realize

- ◆ currently using **digital certificates**; ongoing research towards a better approach...

# Overall: Public-key encryption & signatures

Assume a trusted set-up

- ◆ public keys are securely available (PKI) & secret keys remain secret

Assignment Project Exam Help

# Secret-key vs. public-key encryption

	Secret Key (Symmetric)	Public Key (Asymmetric)
Number of keys	1	2
Key size (bits)	56-112 (DES), 128-256 (AES)	Unlimited; typically no less than 256; 1000 to 2000 currently considered desirable for most uses
Protection of key	Must be kept secret	One key must be kept secret; the other can be freely exposed
Best uses	Cryptographic workhorse. Secrecy and integrity of data, from single characters to blocks of data, messages and files	Key exchange, authentication, signing
Key distribution	Must be out-of-band	Public key can be used to distribute other keys
Speed	Fast	Slow, typically by a factor of up to 10,000 times slower than symmetric algorithms

# Public-key cryptography: Early history

## Proposed by Diffie & Hellman

- ◆ documented in “New Directions in Cryptography” (1976)
- ◆ solution concepts of public-key encryption schemes & digital signatures
- ◆ key-distribution systems
  - ◆ Diffie-Hellman key agreement protocol
    - ◆ “reduces” symmetric crypto to asymmetric crypto

Public-key encryption was earlier (and independently) proposed by James Ellis

- ◆ classified paper (1970)
- ◆ published by the British Governmental Communications Headquarters (1997)
- ◆ concept of digital signature is still originally due to Diffie & Hellman

Assignment Project Exam Help

<https://powcoder.com>

**7.2 Public-key certificates**

Add WeChat powcoder

# How to set up a PKI?

- ◆ How are public keys stored? How to obtain a user's public key?
- ◆ How does Bob know or 'trust' that  $A_{PK}$  is Alice's public key?
- ◆ How  $A_{PK}$  (a bit-string) is securely bound to an entity (user/identity)?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

public key:  $A_{PK}$   
secret key:  $A_{SK}$

public key:  $B_{PK}$   
secret key:  $B_{SK}$

# Achieving a PKI...

How can we maintain the invariant that at all times

- ◆ any given **user U** is **assigned** a **unique** public-private key pair; and
- ◆ any other user knows U's current public key?

- ◆ secret keys can be lost, stolen or they should be revoked

entails binding  
users/identities  
to public keys

Recall

- ◆ PK cryptosystems come with a Gen algorithm which is run by U
  - ◆ on input a security-strength parameter, it outputs a random valid key pair for U
- ◆ public keys can be made publicly available
  - ◆ e.g., sent by email, published on web page, added into a public directory, etc.

# Distribution of public keys

## Public announcement

- ◆ users distribute public keys to recipients or broadcast to community at large

## Publicly available directory

- ◆ can obtain greater security by registering keys with a public directory

Both approaches have problems and are vulnerable to forgeries

Add WeChat powcoder

# Do you trust your public key?

- ◆ Impostor claims to be a true party
  - ◆ true party has a public and private key
  - ◆ impostor also has a public and private key
- ◆ Impostor sends impostor's own public key to the verifier
  - ◆ says, "This is the true party's public key"
  - ◆ this is the critical step in the deception

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Certificates: Trustable identities & public keys

## Certificate

- ◆ a public key & an identity **bound** together
- ◆ in a document **signed** by a certificate authority

## Certificate authority (CA)

- ◆ an authority that users **trust** to securely bind identity to public keys
  - ◆ CA **verifies identities** before generating certificates for these identities
  - ◆ secure binding via **digital signatures**
    - ◆ **ASSUMPTION**: The authority's PK  $CA_{PK}$  is authentic

# Public-key certificates in practice

Current (imperfect) practice for achieving trustable identities & public keys

- ◆ everybody trusts a Certificate Authority (CA)
  - ◆ everybody knows  $PK_{CA}$  & trusts that CA knows the corresponding secret key  $CA_{SK}$
- ◆ a certificate binds identities to public keys in a CA-signed statement
  - ◆ e.g., Alice obtains a signature on the statement “Alice’s public key is 1032xD”
- ◆ users query CA for public keys of intended recipients or signers
  - ◆ e.g., when Bob wants to send an encrypted message to Alice
    - ◆ he first **obtains & verifies** a certificate of Alice’s public key
  - ◆ e.g., when Alice wants to verify the latest software update by Company
    - ◆ she first **obtains & verifies** a certificate of Company’s public key

# Example

a certificate is a public key and an identity bound together and signed by a certificate authority (CA)

Document containing the public key and identity for Mario Rossi

Certificate Authority's private key

## Mario Rossi's Certificate

document signed by CA

a certificate authority is an **authority** that users **trust** to accurately verify identities before generating certificates that bind those identities to keys

# Certificate hierarchy

Single CA certifying every public key is impractical

Instead, use trusted ~~Assignment Project Exam Help~~ certificate authorities

- ◆ root CA signs certificates for intermediate CAs, they sign certificates for lower-level CAs, etc.
- ◆ certificate “chain of trust”
  - ◆  $\text{sig}_{\text{Symantec}}(\text{“Stevens”}, \text{PK}_{\text{Stevens}})$
  - ◆  $\text{sig}_{\text{UMD}}(\text{“faculty”}, \text{PK}_{\text{faculty}})$
  - ◆  $\text{sig}_{\text{faculty}}(\text{“Nikos”}, \text{PK}_{\text{Nikos}})$

# Example 1: Certificate signing & hierarchy

## To create Diana's certificate:

Diana creates and delivers to Edward:

Name: Diana
Position: Division Manager
Public key: 17EF83CA ...

Edward adds:

Name: Diana	hash value
Position: Division Manager	128C4
Public key: 17EF83CA ...	

Edward signs with his private key:

Name: Diana	hash value
Position: Division Manager	128C4
Public key: 17EF83CA ...	

Which is Diana's certificate.

## To create Delwyn's certificate:

Delwyn creates and delivers to Diana:

Name: Delwyn
Position: Dept Manager
Public key: 3AB3882C ...

Diana adds:

Name: Delwyn	hash value
Position: Dept Manager	48CFA
Public key: 3AB3882C ...	

Diana signs with her private key:

Name: Delwyn	hash value
Position: Dept Manager	48CFA
Public key: 3AB3882C ...	

And appends her certificate:

Name: Delwyn	hash value
Position: Dept Manager	48CFA
Public key: 3AB3882C ...	
Name: Diana	hash value
Position: Division Manager	128C4
Public key: 17EF83CA ...	

Which is Delwyn's certificate.

Add WeChat powcoder

# Assignment Project Exam Help

<https://powcoder.com>

**7.3 Hybrid encryption**

Add WeChat powcoder

# Secret-key cryptography is “reduced” to public-key

PK encryption can be used “on-the-fly” to securely distribute session keys

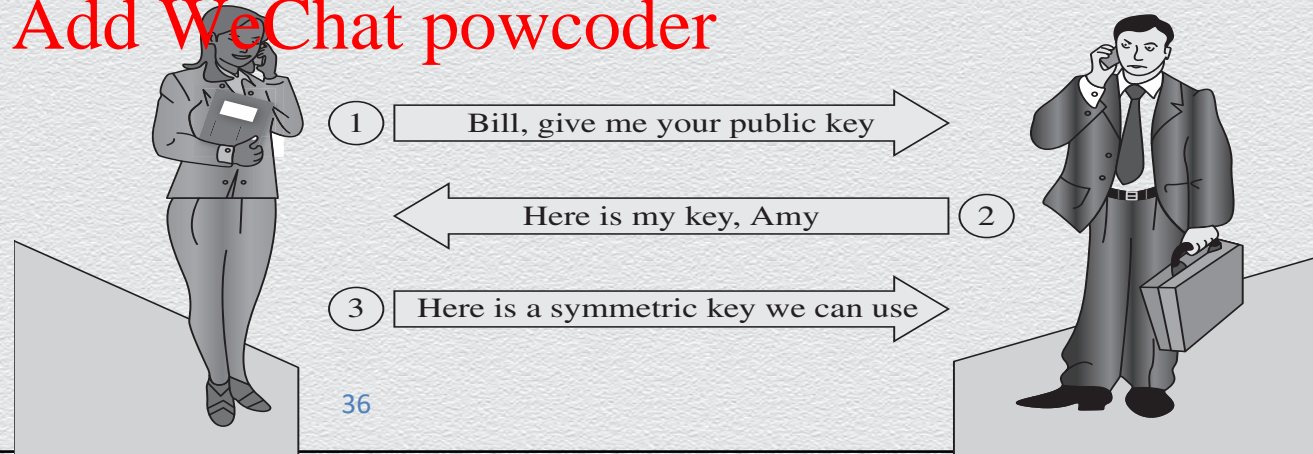

Main idea: Leverage PK encryption to securely distribute session keys

- ◆ sender generates a fresh session-specific secret key  $k$  and **learns** receiver's public key  $R_{pk}$
- ◆ session key  $k$  is sent to receiver encrypted under key  $R_{pk}$
- ◆ session key  $k$  is employed to run symmetric-key crypto
- ◆ e.g., how **not** to run above protocol

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Hybrid encryption

“Reduces” secret-key crypto to public-key crypto

- ◆ better performance than block-based public-key CPA-encryption
- ◆ main idea
  - ◆ apply PK encryption on random key  $k$
  - ◆ use  $k$  for secret-key encryption of  $m$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Hybrid encryption using the KEM/DEM approach

“Reduces” secret-key crypto to public-key crypto

- ◆ main idea
  - ◆ **encapsulate** secret key  $k$  into  $c$
  - ◆ use  $k$  for secret-key encryption of  $m$
  - ◆ KEM: key-encapsulation mechanism - Encaps
  - ◆ DEM: data encapsulation mechanism - Enc'
- ◆ KEM/DEM scheme
  - ◆ CPA-secure if KEM is CPA-secure and Enc' EAV-secure
  - ◆ CCA-secure if KEM and Enc' are CCA-secure

Assignment Project Exam Help

<https://powcoder.com>

**7.4 The Discrete Log  
problem & its  
applications**

Add WeChat powcoder

# The discrete logarithm problem

## Setting

- ◆ if  $p$  be an odd prime, then  $G = (Z_p^*, \cdot)$  is a cyclic group of order  $p - 1$ 
  - ◆  $Z_p^* = \{1, 2, 3, \dots, p-1\}$ , generated by some  $g$  in  $Z_p^*$ 
    - ◆ for  $i = 0, 1, 2, \dots, p-2$ , the process  $g^i \bmod p$  produces all elements in  $Z_p^*$
  - ◆ for any  $x$  in the group, we have that  $g^k \bmod p = x$ , for some integer  $k$
  - ◆  $k$  is called the **discrete logarithm** (or **log**) of  $x \pmod{p}$

## Example

- ◆  $(Z_{17}^*, \cdot)$  is a cyclic group  $G$  with order 16, 3 is the generator of  $G$  and  $3^{16} = 1 \bmod 17$
- ◆ let  $k = 4$ ,  $3^4 = 13 \bmod 17$  (which is easy to compute)
- ◆ the inverse problem: if  $3^k = 13 \bmod 17$ , what is  $k$ ? what about **large  $p$** ?

# Computational assumption

## Discrete-log setting

- ◆ cyclic  $G = (\mathbb{Z}_p^*, \cdot)$  of order  $p - 1$  generated by  $g$ , prime  $p$  of length  $t$  ( $|p| = t$ )

## Problem

Assignment Project Exam Help

- ◆ given  $G, g, p$  and  $x$  in  $\mathbb{Z}_p^*$ , compute the discrete log  $k$  of  $x \pmod p$
- ◆ we know that  $x = g^k \pmod p$  for some unique  $k$  in  $\{0, 1, \dots, p-2\}$ ... but

<https://powcoder.com>

## Discrete log assumption

Add WeChat powcoder

- ◆ for groups of specific structure, **solving the discrete log problem is infeasible**
- ◆ any efficient algorithm finds discrete logs negligibly often ( $\text{prob} = 2^{-t/2}$ )

## Brute force attack

- ◆ cleverly enumerate and **check  $O(2^{t/2})$  solutions**

# ElGamal encryption

Assumes discrete-log setting (cyclic  $G = (\mathbb{Z}_p^*, \cdot) = \langle g \rangle$ , prime  $p$ , message space  $\mathbb{Z}_p$ )

## Gen

- ◆ secret key: random number  $x \in \mathbb{Z}_p^*$       public key:  $A = g^x \bmod p$ , along w/  $G, g, p$

## Enc

- ◆ pick a fresh random  $r \in \mathbb{Z}_p^*$  and set  $R = A^r (= g^{xr})$
- ◆ send ciphertext       $\text{Enc}_{\text{PK}}(\mathbf{m}) = (\mathbf{c}_1, \mathbf{c}_2)$       where  $\mathbf{c}_1 = g^r$ ,  $\mathbf{c}_2 = \mathbf{m} \cdot R \bmod p$

## Dec

- ◆  $\text{Dec}_{\text{SK}}(\mathbf{c}_1, \mathbf{c}_2) = \mathbf{c}_2 (1/\mathbf{c}_1^x) \bmod p$       where  $\mathbf{c}_1^x = g^{xr}$

Security is based on **Computational Diffie-Hellman** (CDH) assumption

- ◆ given  $(g, g^a, g^b)$  it is hard to compute  $g^{ab}$

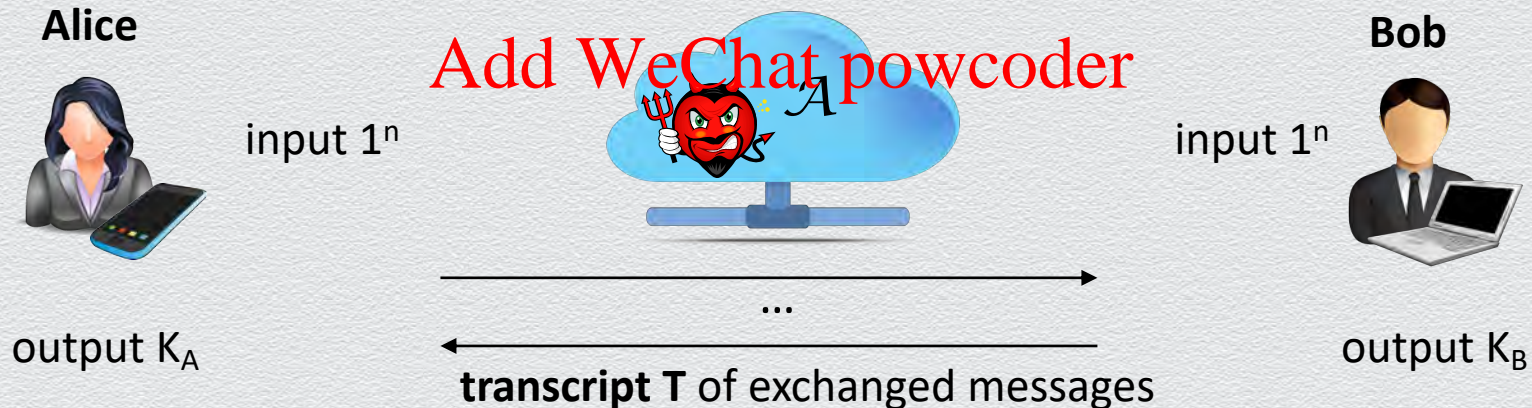

A signature scheme can be also derived based on above discussion

# Application: Key-agreement (KA) scheme

Alice and Bob want to securely establish a **shared key** for secure chatting over an **insecure** line

- ◆ instead of meeting in person in a secret place, they want to use the insecure line...
- ◆ KA scheme: they run a key agreement protocol  $\Pi$  to contribute to a **shared key**  $K$
- ◆ correctness:  $K_A = K_B$
- ◆ security: no PPT adversary  $\mathcal{A}$ , given  $T$ , can distinguish  $K$  from a truly random one

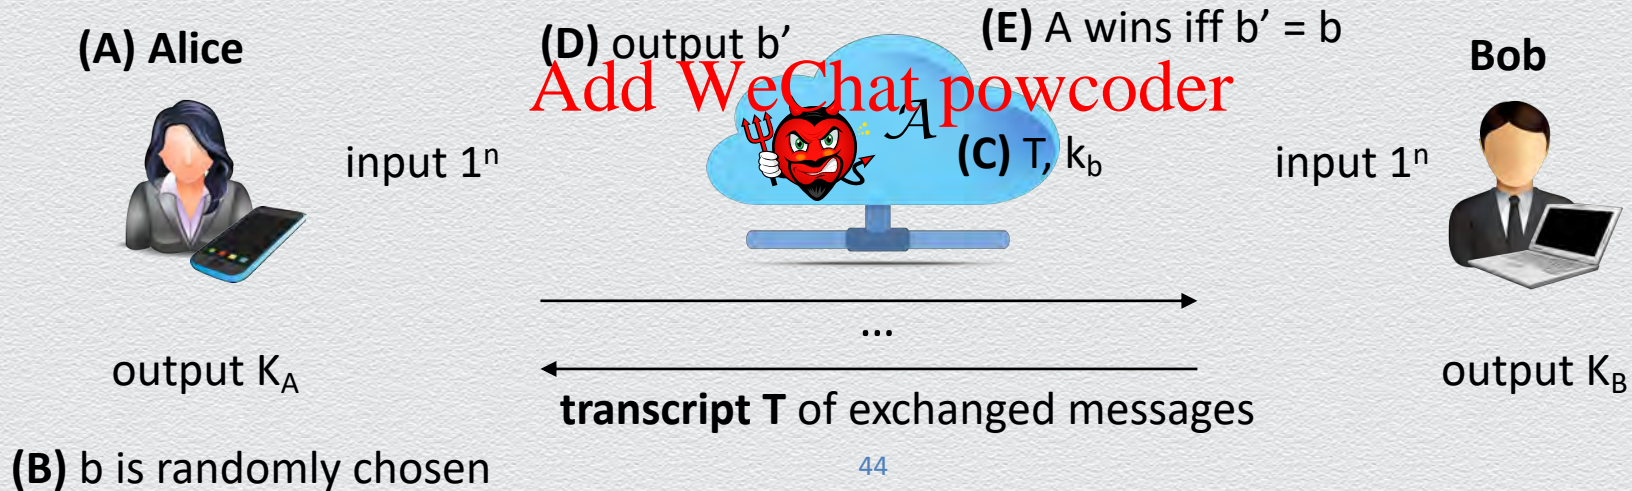

# Key agreement: Game-based security definition

- ◆ scheme  $\Pi(1^n)$  runs to generate  $K = K_A = K_B$  and transcript  $T$ ; random bit  $b$  is chosen
- ◆ adversary  $\mathcal{A}$  is given  $T$  and  $k_b$ ; if  $b = 1$ , then  $k_b = K$ , else  $k_b$  is random (both  $n$ -bit long)
- ◆  $\mathcal{A}$  outputs bit  $b'$  and wins if  $b' = b$
- ◆ then:  $\Pi$  is secure if no PPT  $\mathcal{A}$  wins non-negligibly often

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# The Diffie-Hellman key-agreement protocol

Alice and Bob want to securely establish a **shared key** for secure chatting over an **insecure** line

- ◆ DH KA scheme  $\Pi$

- ◆ discrete log setting:  $g$  public, where  $\langle g \rangle = \mathbb{Z}_p^*$  and  $p$  prime

Alice

input  $1^n$

(1) randomly pick secret  $a$

<https://powcoder.com>

Add What powcoder

(3) send  $g^a \bmod p$

(4) send  $g^b \bmod p$

(5) set  $K = g^{ab} \bmod p = (g^b \bmod p)^a \bmod p$

Bob

input  $1^n$

(2) randomly pick secret  $b$

(6) set  $K = g^{ab} \bmod p = (g^a \bmod p)^b \bmod p$

# Security

- ◆ discrete log assumption is necessary but not sufficient
- ◆ decisional DH assumption
  - ◆ given  $g$ ,  $g^a$  and  $g^b$ ,  $g^{ab}$  is computationally indistinguishable from uniform
